

## The Termidor Zone VS. Bait Systems

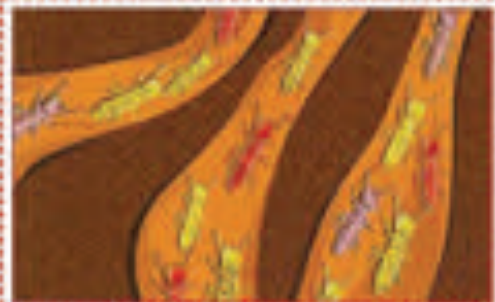

When your home is treated with Termidor, a "Treated Zone" is established around the home. This is done using proven, time tested techniques that Zoellner Exterminating is very knowledgeable about and familiar with.

When a Bait System is installed around your home, you have monitors or bait stations placed every 8-10 feet around the house. In most systems there is nothing more protecting your home but wood monitoring devices. In many cases, bait will not be added until there is termite activity in one or more of the stations.

Termidor - Day One:

Termites wander into the treated zone and pick up the active ingredient. Considering they are social insects that feed and groom each other and care for the queen, most become 'carriers' that are beginning to infect others in the colony.

Bait System - Day One:

No termites have wandered into the monitoring/bait stations yet. Bummer.

**Termidor - A Few Days Later:**

Termidor has been transferred to many in the colony. Many have already died, but the 'transfer effect' continues to kill those who have not even gone into the treated zone.

**Bait System - A Few Days Later:**

Still, there may be no activity in the stations. Just termites eating your home. oh darn.

**Termidor - Within 3 Months:**

100% Control! NO MORE termites to damage your home. The Termidor is still in the soil around your home providing protection against any new invading termite colonies.

**Bait System - Within 3 Months:**

Termites MIGHT have found the monitors at this point. Although, many times it can take up to 18 MONTHS! However, unless there is sufficient activity, the FCO still might not apply any bait materials yet. Even if there is enough termite activity to bait, those critters are still feeding on your home too.

How much did that cost? Ouch.

#### Interesting Facts About Termidor

- Termidor does not require any special equipment to apply. The same equipment PCOs have been using for years is all that's required.
- The odds of termites wandering into a Termidor zone are much greater than wandering into a bait or monitoring station.
- 100 gallons of Termidor solution contains only 8.4 ounces of the active ingredient (when mixed at the label rate of .06% WG formulation)
- Termidor is not affected by debris, dryness, insects, or fungal decay
- Termidor is effective with all types of soil, in all kinds of climates, and on many species of termites.
